

Project 2

The goal of this project is to study the job market of data analytics related roles. The data which will be used will be data scraped from Glassdoor and Indeed using the starter code the group created in the ETL project. We intend to show a time scale of prevalence of jobs in the data industry as well as densities of different targeted positions. The graphs will include maps, bar charts, as well as other visualizations related to the data.

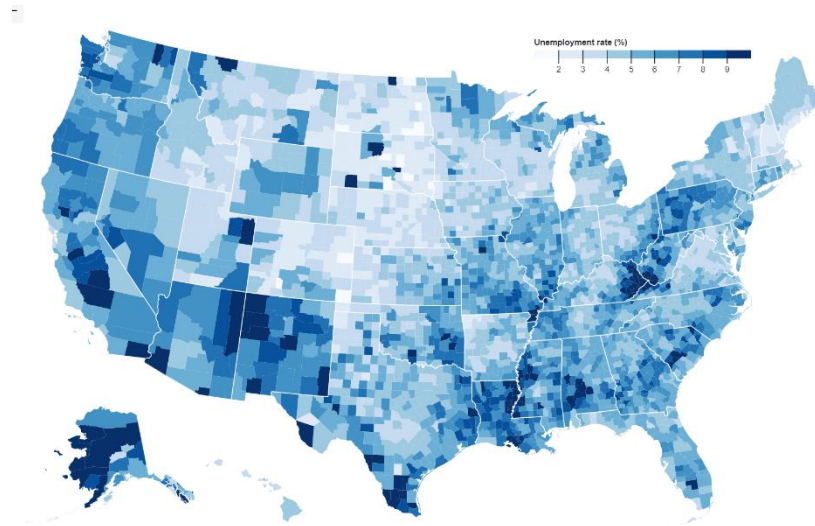

The data will at first be derived from the prior ETL project (<https://github.com/taylorbreychak/ETL-Project>).

A dashboard will be created using plotly that resembles this image:

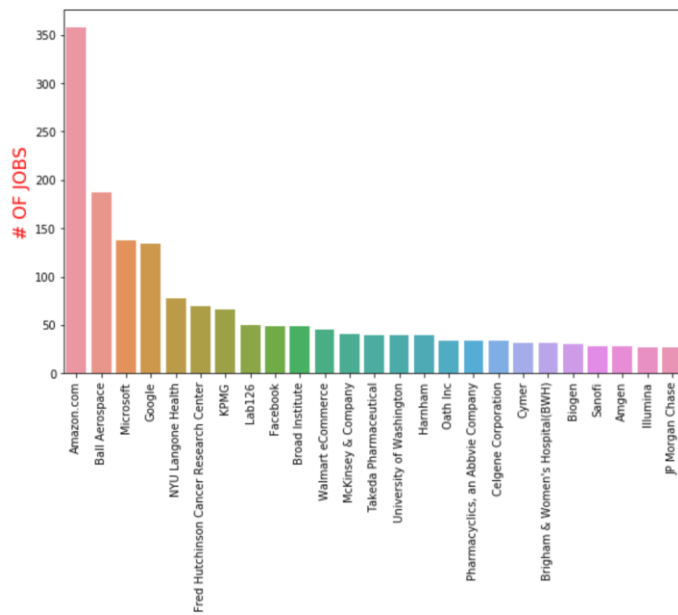

Example of charts

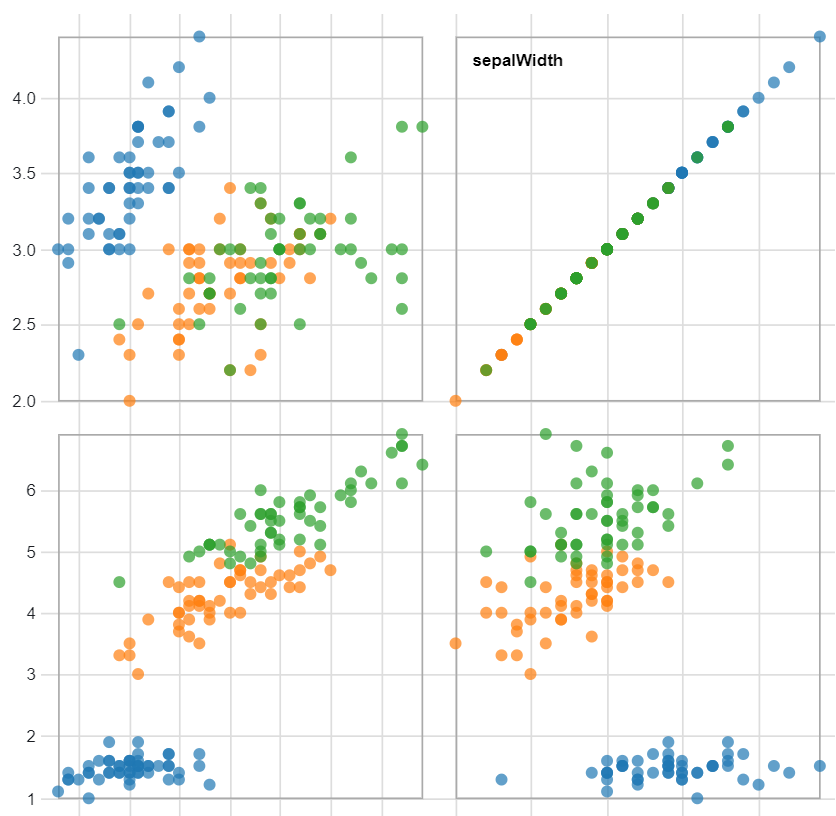

Density Map

Bar Chart (by role, by region, by time)

Scatterplot
